ABSTRACT
In this study, the potential of translanguaging to revolutionize English language education is investigated. Through a systematic literature review of 15 articles, the breadth of literature on translanguaging is explored, and aspects such as research contexts, age groups, and key findings are identified, along with highlighting gaps in the current understanding. The study reveals a growing interest in translanguaging within English Language Teaching, emphasizing its flexibility in different learning environments and its impact on language learning and identity development. While the research highlights the promise of these techniques, it also identifies limitations in the existing literature, such as the lack of age information, quantitative data, and generalizability. The study concludes that translanguaging and bridging techniques hold significant potential to bridge gaps in language education, particularly in multicultural and multilingual settings. To advance knowledge, future research should address these limitations and involve students in narrative inquiries, exploring the long-term effects of these pedagogical approaches.

Keywords: Translanguaging, ELT, Pedagogical Strategies, Multilingual Education.
1 INTRODUCTION

1.1 GENERAL OVERVIEW OF ENGLISH LANGUAGE TEACHING AROUND THE COUNTRY

In accordance with the English Education First (2022) ranking, Ecuador finds itself situated at one of the lower places within the Latin American context in terms of English language proficiency. This prevailing circumstance is commonly attributed to the perceived deficiency of effective pedagogical strategies in the realm of English language instruction for students. According to Calle et al. (2012), there are a number of aspects of the teaching and learning of the English language in the Ecuadorian environment that have an impact on students’ subpar performance. One of these causes has to do with the fact that English language instructors in public schools do not use teaching methods that foster the growth of communicative competence in their classes. This is primarily due to the fact that they still rely on conventional teaching techniques, which have a direct bearing on the general low academic performance of Ecuadorian students.

There was a remarkable historical trajectory for the introduction of English language instruction in secondary schools in Ecuador. Such training was noticeably absent before 1912, though. After that, English language instruction began in many schools across the country, eventually leading to its required inclusion in the national curriculum in 1950. The allocation of instructional hours for English was still in its early stages, and it was clear that there were few instructors who were proficient in teaching the language. But as time passed, there were noticeable improvements in this circumstance. In 1992, the pedagogical environment for English instruction in Ecuador saw significant improvement, particularly as a result of the Ministry of Education’s implementation of the CRADLE project (Cifuentes-Rojas, et al., 2019).

As per Harvey (2016), between 2006 and 2015, Ecuador underwent a comprehensive education reform under the administration of Rafael Correa, which introduced several changes concerning the rights of teachers and students. Presently, English teachers are required to obtain a certification at a B2 level or higher. The teaching of the English language in Ecuador has evolved progressively to the extent that it is now incorporated into the curriculum of all schools, be they public, private, and semi-private schools (Vélez, et al., 2023).

Regarding higher education, knowing a second language, usually English, at a B1 level at least, following the proficiency levels outlined by the Common European Framework of Reference for Languages (CEFR), is a graduation requirement. According to the Academic Regulations, approved in 2017, Article 31 states the following:
The Higher Education Institution shall ensure the language proficiency level to meet the graduation requirement for undergraduate programs... In third-level, undergraduate programs, proficiency in a foreign language shall be understood as at least the level corresponding to B1 of the Common European Framework of Reference for Languages (p. 17).

Furthermore, the methodology employed in the teaching and learning process of this language varies from one university to another and is contingent on the instructor delivering the course (Rodas, 2023).

The four universities in Cuenca include English as a requirement for graduation, with each university having a different proficiency standard that students must meet. Students at the Catholic University, for instance, must achieve at least a B1 level. The Language Department is in charge of providing these courses.

1.2 BRIDGING TECHNIQUES FOR MEANING CLARIFICATION

Educators around the world continually seek new approaches and techniques to effectively engage students as they try to improve their English language proficiency. The use of translanguage as a link to meaningful communication and understanding is an ongoing debate in English language education research. Basically, translanguage encourages students to strategically use their entire linguistic repertoire, including their first language, to enhance learning by recognizing their multilingual capacity (García, 2019; Wei, 2022).

The use of bridging strategies is crucial within this paradigm. They serve as an essential link between the student's present language proficiency and the target language, in this case, English. These methods offer a more thorough and contextually significant way to learn a new language by utilizing brain connections between various languages (Back; Han; Weng, 2020; Fine, 2022).

Considering that students learning English frequently encounter foreign vocabulary, challenging grammatical structures, and pronunciation problems, bridging strategies are particularly useful in this environment. These approaches recognize that language does not exist in a void but is linked to people's cultural and cognitive experiences. (Barbour; Lickorish Quinn, 2020; Khote, 2018) They provide students with the ability to communicate in and understand English using the grammar and vocabulary of the language (Barbour; Lickorish Quinn, 2020; Khote, 2018).

Bridging techniques also reinforce the pedagogical premise that learning should be a cognitive activity that builds on prior knowledge (Hansen-Thomas et al., 2021). Teachers can foster a more inclusive and empowered learning environment by promoting students' use of their first language and fostering knowledge transfer between this latter and the new targeted language.

It is essential to take into account the English teachers’ involvement in this situation. Teachers are becoming more than just stewards of the English language; they are also guides who help students find
their way through the language learning path (Pontier; Gort, 2016). A friendly and encouraging environment where students feel comfortable experimenting with language and meaning-making must be created by teachers in order to guide students in the effective use of connection approaches (Lee, 2022).

This research piece intends to shed light on the relevance of translanguaging and bridging strategies in the Ecuadorian educational setting as we go deeper into the investigation of their use in teaching English as a foreign language. These novel strategies could be advantageous for Ecuador, like many other nations working to increase English language competency (Ra, 2021). We aim to clarify how translanguaging, in combination with bridging techniques, might empower learners, challenge traditional paradigms in language education, and contribute to a more robust English language teaching experience by evaluating existing literature and research data, efficient and open to anyone.

The next sections of this study will go into greater detail on the idea of translanguaging, exploring its numerous facets and offering information on how it has been successfully used in EFL classes. It will also look into the unique situation of Ecuador and its educational system in order to identify the advantages and disadvantages of the use of translanguaging and bridging methods (Schissel et al., 2021). It aims to add to the ongoing discussion surrounding cutting-edge EFL teaching approaches and their potential to revolutionize language education in Ecuador and beyond through a thorough systematic review of bibliographic studies and available literature on the topic (Moody et al., 2022).

1.3 TRANSLANGUAGING

The idea of translingualism encourages students to move beyond the limitations of certain linguistic characteristics like modes and structures by focusing on the interconnection of languages. This strategy tries to promote language learning and meaning creation. It is frequently used as an instructional method to enhance learning and recognize speakers’ dynamic and varied linguistic and cultural identities (Mazak; Carroll, 2016). This strategy offers four possible educational advantages: improving topic knowledge, assisting in the development of weaker languages, encouraging parent-school communication, and easing the integration of proficient speakers with young learners (Caruso, 2018).

In line with Canagarajah’s perspective (2013), the concept of translingual practice challenges the conventional separation of languages in English as a Foreign Language (EFL) instruction. Canagarajah asserts that English has always evolved as a creolized language, interweaving with various other languages throughout its history (p. 90). Therefore, when we take into account the ideologies, historical contexts, and identities that influence language usage, we actively contribute to its ongoing development. This approach yields significant benefits when implementing Translanguaging in EFL classrooms, as it enables
students from diverse linguistic backgrounds to utilize their native language strategically as a tool for bridging gaps in their English proficiency (Barros et al., 2021).

Caruso’s study (2018) demonstrates that in classrooms where translanguaging was employed, students’ individual language skills became more actively utilized, leading to the establishment of a collaborative learning environment facilitated by the collective linguistic resources within the classroom. This stands in contrast to other language policies that promote the use of a single lingua franca, typically English, resulting in diverse linguistic backgrounds within the same classroom. While implementing multilingualism may pose challenges on a larger scale, such as due to curriculum requirements or the emphasis on monolingual assessment standards, it can be advantageous for teacher education by introducing "an alternative cultural approach for envisioning fairer instruction that aligns with the linguistic complexities observed in transnational classrooms" (Barros et al., 2021, p. 13).

That being said, it is worth noting that the majority of research on the educational application of translanguaging has predominantly concentrated on primary and secondary education within countries like the UK and the US. Consequently, investigations targeting university-level students in multilingual nations have been relatively recent and limited in number which poses a potential niche of research especially in our context. One of the rare instances can be found in the research conducted by Carroll and Mazak (2017) in Puerto Rico. In this context, many universities lacked explicit policies regarding the language of instruction. Nevertheless, those institutions that had an open approach demonstrated a higher incidence of translanguaging practices, provided that these language practices were deliberate and student-centric. This situation can be attributed to Puerto Rico’s colonial relationship with the United States and the prominence of English as an international academic language. As a result, the examination of translanguaging in settings like Ecuador, where the presence of languages other than Spanish in a multicultural environment is still relatively underexplored, is particularly significant.

1.4 TRANSLANGUAGING VS CODE-SWITCHING

As mentioned before, translingualism is about showing how everything is connected and looking at individuals, their background, their perceptions of the world, and their internal points of view of language use. It acts as the input, representing the first language that undergoes a process of analysis and, finally, becomes the output, which is the target language.

Whereas, code-switching looks only at language from the outside and its grammatical patterns, as well as interactional rules. In other words, it refers to the switch from one language to another without caring about the language processing of any of them in a particular communicative episode. Additionally, code-switching can be considered a strategy used in translanguaging practices and at specific moments of a class.
1.5 ENCOMPASSING TRANSLANGUAGING AND THE NATIONAL CURRICULUM – IS IT DIVERGENT FROM IT?

The discussion revolving around curriculum and English language teaching methods has been a constant concern of lawmakers and those who abide by them. Many places have tried to adapt their educational paradigms to the most 'innovative' ones. The core argument put forth in this context suggests that the integration of translanguaging principles necessitates the reshaping of curriculum design and execution. In this light, there is a resounding call to action for the creation of a multilingual curriculum, one that not only recognizes the inherent value embedded within learners' preexisting knowledge and experiential backgrounds but also actively promotes the incorporation of multiple languages (should that be the case) and diverse meaning-making tools throughout the entire educational process (Wei, 2022).

Cascading our focus to the Ecuadorian educational landscape, the Communicative Language Teaching (CLT) has gained a reputation as a powerful approach to language instruction by making it part of its curricular core since 2016. Teachers all around the country were lighting up with enthusiasm as they put CLT principles into practice in their classrooms (Murga et al., 2018). But our educational landscape is diverse, and one-size-fits-all approaches do not always work. While CLT is crucial, we also recognize the value of drawing from various teaching methods and techniques to meet the needs of our students. Nowhere is translanguaging mentioned in the national curriculum. Nonetheless, it is important to remember that most of our teachers here are not native English speakers, as Carrión et al. (2023) mentioned. This context brings its own set of challenges and opportunities. One of those opportunities is to make use of translanguaging to empower students by giving value to the things they already know. To illustrate the effectiveness of translanguaging in our context, Pánchez-Jiménez’s (2021) research looked into how translanguaging can help students improve their oral reading skills, and the results were positive. Not only does this research highlight the value of translanguaging, but it also showcases how it fits right into our educational setting.

Moreover, Pánchez-Jiménez’s work sheds light on the importance of translanguaging in Latin American countries like ours. It acknowledges the nuances and challenges specific to our region, which is a significant step forward in our academic discussions on language teaching. Translanguaging, as described by Galante (2020), is a game-changer since it strengthens students by letting them connect their existing knowledge and language skills with their journey to learn a foreign language - English. This approach helps them grasp the finer details of vocabulary choices and meaning-making processes, all while considering their native language and cultural background. It is like starting from familiar grounds and then building upon it to construct a deeper understanding of the target language.
There is some discussion of curriculum development in the PDF file. The article argues that the use of translanguaging in language education requires a shift in curriculum development from a monolingual to a multilingual approach. It suggests that a multilingual curriculum should be developed that recognizes the value of learners' existing knowledge and experiences, and that promotes the use of multiple languages and other meaning-making resources in teaching and learning. The article also discusses the need for teacher training and support to enable them to implement a multilingual curriculum effectively.

2 METHODOLOGY

This research piece aims to find whether or not the use of translanguaging in an EFL has been proven to be useful. In order to get quantitative information that may serve as a solid foundation for future research projects, this study was carried out as a systematic literature review. For this study, 15 articles on the topic have been dissected to analyze aspects related to the study participants, their ages, key findings, and the rise or decrease in popularity in the last few years.

The selection criteria for the chosen articles in this systematic literature review were the following: (1) articles that have been published and peer-blinded reviewed in high-impact journals preferably belonging to any of the quartiles of the clusterings in Scopus, (2) the articles have been written in terms of English either as a foreign or second language, with students belonging to different age groups and levels of proficiency, and (3) studies carried out in the last 5 years. In the realm of academia, it is imperative that each of these documents adheres to an information standard encompassing statistical data, precise definitions, pedagogical interventions, recommendations, and comprehensive literature reviews. The search engines used for this study are Scopus, Google Scholar, ERIC, and BASE.

2.1 OBJECTIVES

- Explore the breadth of literature available on translanguaging;
- identify aspects such as age, English proficiency level, participants, and key findings;
- highlight aspects that may be pondered in terms of the relevance of this in our context;
- identify niches of investigations so as to propose further studies to enrich the available literature.

2.2 RESEARCH QUESTIONS

- In what contexts, age groups, and countries, has translanguaging been explored and researched in the selected studies?
• What gaps and unexplored areas exist within the current understanding of translanguaging?

3 RESULTS AND DISCUSSION

This section is meant to provide the results and foster a comprehensive discussion on the impact and implications of translanguaging as an innovative pedagogical strategy popularity in recent years, by leveraging the power of linguistic connections and bridging techniques, this research seeks to illuminate the ways in which this approach can enhance English language instruction, making it more inclusive and effective. The forthcoming results and discussion aim to shed light on the potential of translanguaging to enrich the teaching and learning of English, ultimately fostering cross-cultural communication and linguistic empowerment.

The purpose of this part is to provide the findings and promote a thorough debate of the effects and consequences of translanguaging as a cutting-edge pedagogical approach. This study aims to shed light on how this method can improve English language training by making use of linguistic linkages and bridging strategies, making it more inclusive and efficient. The upcoming findings and debate are intended to highlight how translanguaging might improve English teaching and learning, eventually promoting cross-cultural interaction and language empowerment.

Source: Tables obtained from scopus.com

As seen in Table 1, the subject of translanguaging within the English Language Teaching (ELT) field has gained a noticeable popularity over recent years. This surge in interest can be attributed to a
growing inclination to rekindle certain pedagogical approaches prominent to the so-called ‘traditional’ methods. Simultaneously, it shows appropriateness to the reality of today’s globalized world. Furthermore, giving a glance and search on Scopus, high-impact articles appeared with a total of 2,163 on translanguaging published in the last years. Interestingly, it is worth mentioning that the two nations in which the topic has been more popular - the United States, with 723 publications, and the United Kingdom, with 279 publications - are countries predominantly associated with a population with various language and cultural backgrounds, and have collectively contributed significantly to this discussion. This phenomenon is particularly noteworthy considering the rich cultural diversity within these countries, underlining the significance of acknowledging and empowering such multilingual practices on a global scale. As emphasized by a prominent scholar and a big player in the area, Ofelia Garcia (2019), this trend aligns with the broader recognition of the importance of linguistic and cultural diversity in contemporary education.

Note. 15 articles were listed in this study
Source: Own elaboration. The data presented in this table were compiled from the following 15 articles: [List of full references of the 15 articles].
As seen in Table 2, the studies focusing on translanguaging practices in a wide variety of educational contexts bring some interesting findings. Translanguaging, as the strategic and purposeful mixing of languages used as a pedagogical tool, is illustrated as a flexible approach in contextual requirements for different learning types. For instance, in the study carried out by Adinolfi and Astruc (2017) mentions that teachers often resorted to code-switching mainly through L2-L1 paraphrasing as it was one of the ways of assisting students in online beginner-level foreign language classrooms. However, this was not the case in complete online settings where this practice was limited, hence further emphasizing the impact of the learning environment on translanguaging dynamics.

Moreover, it proved instrumental in increasing and reshaping their multilingual competence and adaptability to a large extent. In an emergent bilingual children study by Axelrod and Cole (2018), they stated that the students started using their whole linguistic repertoires, increasingly sophisticated, suggesting that they were capable of being conscious and strategic users of multiple languages. In the results of a study conducted by Hansen-Thomas et al. (2021), the effectiveness of co-learning via translanguaging in high school English classrooms is also highlighted. While it may have been an inappropriate pedagogic tool for teachers of multilingual students, tensions arose as to translation and technology and even the eagerness of students towards learning the target language. Taken together, these studies in combination collectively reveal the nuances of translanguaging and its inflection on language learning, instruction, and multilingual identity development, which is key to knowing where and how translanguaging should be better applied.
As seen in Table 3, there were certain restrictions in the selected bibliography. One publication lacked information on the actual results or effects of the translingual strategy on students, which was reflected in the absence of student outcomes. This can make it difficult to evaluate the strategy's efficacy. Six articles in particular lack student perspectives, which may point to a knowledge gap on how students experience and see translingualism. It can be more effective if student opinions are taken into consideration. Insufficient age information (1 article) makes it difficult to determine whether the translingual technique is appropriate for particular age groups or educational levels. Few recent data (4 articles) may suggest that some publications rely on earlier research, which may be less applicable in an educational environment that is continuously changing. Understanding current trends and behaviors necessitates having access to current information. Two articles with language restrictions imply that some articles may not fully address language-related concerns, which are essential to translingualism. This might have an effect on how thorough the study is. Drawing statistically meaningful conclusions on the efficacy of translingual techniques can be difficult due to the small amount of quantitative data (3 articles). To establish stronger evidence, additional quantitative study may be required. The majority of studies have limited generalizability (7 articles), which suggests that researchers may not have given enough thought to how broadly applicable their findings might be. This could have an impact on how applicable the research is to various educational situations. Limited participant diversity (4 articles) raises the possibility that certain studies may not have included a diverse group of participants, which may affect the applicability of the findings to other populations and the ability to generalize the findings. Articles (4 articles) that don't go into great detail about the pedagogical consequences may miss the chance to help teachers successfully apply translingual teaching strategies in the classroom. The narrower issue of translingualism in education may not be fully addressed by the limited discussion of policy consequences (4 articles). Policy talks can aid decision-makers in education with their planning. Readers may not fully appreciate the various barriers and problems connected with implementing translingualism in educational settings due to the limited treatment of challenges (5 articles). The minimal study of long-term effects (2 articles) may suggest that some articles concentrate on immediate results rather than exploring the long-term consequences of translingualism on students and education. Three articles' scant examination of complicated texts raises the possibility that some of them fall short in explaining how translingual techniques might be used to tackle increasingly difficult and complex linguistic issues. Three publications just briefly examine teachers' opinions, suggesting that some articles may not have fully analyzed how educators view and use translingualism. Relying largely on self-reported data (3 articles) increases the risk of biases and mistakes being introduced into research findings, which may undermine the validity of the conclusions. The credibility of research might be damaged by self-contradictory claims (1 article), hence it is crucial to establish internal consistency within articles. The generalizability of results can be
restricted by relying just on single-case studies (2 articles), as they could not accurately reflect larger trends or settings. The depth of study and the capacity to make connections between various features of translingualism may be constrained by the sparse use of theoretical frameworks (2 articles). A small sample size (3 articles) can limit the statistical power of the study and the capacity to draw conclusions that are generalizable. Future study that addresses these constraints may produce a more thorough knowledge of translingual educational practices.

3.1 GAPS FOUND IN THE LITERATURE

Translingualism pertains to the capacity to navigate across diverse languages and cultures. Translingualism can prove to be valuable in several educational niches, including multilingual classrooms, language immersion programs, heritage and multilingual maintenance efforts, Content-Based Language Learning (CBL), translanguaging pedagogy, language for specific purposes, cross-cultural communication, as well as in teacher training and professional development. Notably, the literature review reveals a predominant focus on young learners in previous studies conducted by Hamman (2018), Jones (2017), and Poza (2019), among others. In contrast, studies such as those by Moody, Mathews, and Eslami (2022) and Pun and Tai (2022) predominantly center their attention on educators, overlooking the examination of translingualism’s impact or utilization among adult learners—an aspect that this study aims to address. It is worth noting that translingualism enhances communication skills among adults by endowing them with a broader array of linguistic resources. Consequently, adult translingual individuals often possess diverse language backgrounds shaped by experiences such as residing in multilingual communities, migration, or a multicultural upbringing, all of which contribute to their translingual abilities (Dobchin & Dryden, 2022).

4 CONCLUSION AND RECOMMENDATIONS

The studies dissected in this systematic review show how complicated translanguaging techniques are and how they affect language education. As a result, educators frequently employ code-switching and L2-L1 paraphrasing - not being this the only technique way of implementing translanguaging as an educational approach. Students frequently copy the translingual techniques used by their instructors, which helps them perform well on monolingual written exams as well as in flexible spoken English. The findings of these studies demonstrate the numerous applications of translanguaging and how they impact various educational settings showing the need to implement these strategies in higher education or as an alternative to EMI (English as a
Medium of Instruction). Moreover, students are also taught how to use their multilingual and multimodal skills to challenge stereotypes, develop relationships, and communicate successfully.

Teachers play a critical role in co-learning with emerging bilingual students in dual-language classrooms, where flexible language practices can help or hurt program goals. Additionally, attitudes about multilingualism, language dynamics, and race dynamics are evolving. It has been demonstrated that translanguaging in science classes promotes scientific comprehension, teamwork, and a good learning environment, yet there is a discrepancy between student's ideas and their actual translanguaging behaviors. Lastly, children who translanguage engage in behaviors that foster independent and creative thinking, highlighting the value of experimenting with cutting-edge language pedagogies in educational settings according to the analyzed studies.

Together, these results show how multifaceted translanguaging is and how it might revolutionize pedagogy and language learning by giving value and recognizing everybody’s uniqueness and background. In the chosen bibliography on translingual techniques in education, several shortcomings were found. These restrictions include the absence of student outcomes and viewpoints in some articles, which makes it difficult to evaluate the efficacy of the technique and comprehend how students interact with it. Additionally, it opens up opportunities to study the perceptions students have towards the use of these techniques in class and why not focus on narrative inquiries to see in more detail the stories behind those who translanguage to have a deeper understating of this pedagogical approach. Finally, it is difficult to draw firm conclusions about the efficacy and application of translingual techniques because of the participants' lack of age information (in some cases), the limited language-related concerns, and the absence of quantitative data in some papers – an undeniable gap to look into in future research. The number of articles noted that limited generalizability, participant diversity, discussions of pedagogical and policy implications, exploration of challenges, long-term effects, complex texts, teacher perspectives, and an over-reliance on self-reported information had an impact on the thoroughness, relevance, and credibility of the research. These restrictions highlight the demand for additional studies to address these concerns and provide a more thorough knowledge of translingual techniques in education.
